MOL. B101. 278:57-65(1998).

-!- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY[ADP-RIBOSE].

-!- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMORY TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-!- CATALYTIC ACTIVITY: NADA(+) + (ADP-D-TIBOSY]!(N)-acceptor = nicotinamide + {ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + {ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + ADP-D-TiBOSY]!(N)-acceptor = nicotinamide + ADP-D-TiBOSY]!(N+1)-acceptor = nicotinamide + ADP-D-TIBOSY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                574 KGVGKTAPNPSEAQTLE-DG--VVVPLGKPVE-RSCSKGMLLYNEYIVYNVEQIKMRYVI 629

-!- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DAA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SMART; SM00292; BRCT; 1.

 VWFA.
INTERACTION WITH THE MAJOR VAULT PROTEIN.
NUCLEAR LOCALIZATION SIGNAL IST PART
PROTEINS OF 193 AND 240-kDA.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE NUCLEUS, ASSOCIATED WITH MITOTIC SPINDLES.
-!- TISSUE SPECIFICITY: WIDELY EXPRESSED; THE HIGHEST LEVELS ARE IN THE KIDNEY; ALSO DETECTED IN HEART, PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, SPLEEN, LEGUKOCYTES AND PANCREAS.
-!- SIMILARITY: CONTAINS 1 BRCT DOMAIN.
-!- SIMILARITY: CONTAINS 1 WAFA DOMAIN.

 polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_ZCX_ZMMX_ZC (I). The nucleic acid sequences motif, of general formula CX_ZCX_ZMMX_ZC (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.

This invention describes novel human and murine poly(ADP-ribose) polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD⁺+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2NHX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying pARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.

 This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD⁺-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative lilhess, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.

 4;
 polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_ZXZAMXZ_C(I). The nucleic acid sequences, parP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP3 protein used in the method of the invention.

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (PDI) (ADP-Tibose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, game expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intraoranial arthritis) and dischaemia) inflammatory and autoimmune disorders (e.g. cancer). The present sequence is a PARP protein, the cody, ending which was used to design the antisense

 The present sequence represents the NAP protein of Zea mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polymucleotide sequences can be used for modulation of programmed cell death in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungl or nematodes; are malle or female sterile, or have better seed-shatter properties. The methods are also used to increase growth of transformed plant cells (and derived calli or

 contg. a DNN-binding domain (DBD). It is encoded by AAT13732, from which a fragment comprising nucleotides 67-1220 (-29 to + 1127) encoding the DBD can be inserted into vectors which are used for gene therapy. Over expression of the DBD inhibits the DNN repair function of PARP, so the vectors are useful for gene therapy or tumours, esp. in combination with conventional chemo- and/or radiotherapy.

 This is the human poly (ADP-ribose) polymerase protein (PARP) sequence.
PARP is a 116kD DNA-binding protein that binds tightly to single-strand and double-strand breaks. The PARP protein and Bscherichia coli UvrA and UVRB proteins (see AAY58041-Y58042) are used in a method for the detection and quantitation of DNA base damage. The method involves quantifying at least one modification of inferest in a nucleic acid sequence through the used of capillary electrophoresis, laser induced fluorescence and a fluorescently labeled polypeptide (e.g. fluorescently labeled parper of fluorescently labeled anti-PARP antibody) that is specific for the modification. The new method is useful for quantifying nucleic acid modifications, especially a mutation (including deletions, insertions and substitutions), mismatch, DNA adduct, or strand break (single or double). The method is useful for identifying and detecting exposure to caracthogens, and in early risk assessment for cancer, and is

 The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense

New tankyrase2 polypeptides, useful for treating conditions mediated by poly(adenosine diphosphate-ribose) polymerase activity e.g. cancers, inflammatory and autoimmune disorders -
 The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRFI, which is a telomere-specific binding protein. The regulation of telomere length, in which TRFI has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.

 This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete to ply(adenosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic effects of DNA damage claused by alkylating or oxidizing agents or radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for cancer prevention in subjects at high risk (e.g. those with tumor-associated genetic defects). Tumor-cells treated with (A) show an increased tendency to die when treated with radiation or chemotherapeutic agent, and in cells that survive this treatment they inhibit genomic instability, so should reduce the likelihood of further development of both malignant cells and resistance to chemotherapy. This sequence

Human brain PARP2 protein.

ں :

```
polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD++binding site and no zinc finger sequence with a functional NAD++binding site and no zinc finger sequences with a functional NAD++binding site and no zinc finger sequences. PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP2 protein used in the method of the invention.

transplantation), revascularization of critically constricted coronary arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. leg arteries), treating acute myocardial ischemia and damage during or after its mechanical or dury-induced lysis and treating tumors and their metastasis, sepsis and septic shock, inflammatory and rheumatic disease (e.g. rheumatoid arthritis), and diabetes mellitus. Although (I) inhibit PARP (i.e. the known form designated PARPI), they especially selectively and strongly inhibit PARP homologs, specifically the homolog PARP2. In particular (I) have very strong PARP2 inhibitory activity (e.g. with K.i values of 1-20 nM) and high selectivity for PARP2 relative to PARPI (generally by a factor of more than 5).

This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (1) which are used for the treatment or prophylaxis of diseases associated with elevated poly. (ADP-ribose)-polymerase (PARP; EC 2.4.2.30) activity. The products of the invention have nootropic, neuroprotective, cerebroprotective, antiparkinsonian, nephrotropic, cardiant, vasotropic, anticonvulsant, cytostatic, antibacterial, immunosuppressive, antionnvulsant, cytostatic, antibacterial, antidiabetic. (1) are especially used for treating or preventing neurodegenerative disease or neuronal damage (specifically associated with ischemia, trauma or massive bleeding, especially apoplaxy or spinal-cranial trauma or massive bleeding, especially apoplaxy or spinal-cranial treating or preventing ischemic damage (specifically renal damage after renal ischemia or during and after (specifically renal damage after renal ischemia cischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. petit mal and conplexy partial attacks), treating microinfarction (e.g. temporal lope and complex partial attacks), treating microinfarction (e.g. during and

 17;
CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN (BY
 SIMILARITY).
SUBURT: HOMODIMER (POCENTIAL).
SUBGUELLULAR LOCATION: Nuclear.
MISCELLULAR LOCATION: Nuclear.
MISCELLULAR LOCATION: Nuclear.
MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP ON A HISTONE OR THE BUZYME ITSELF, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.

 Berghammer H., Ebner M., Marksteiner R., Auer B.; "pADPRT-2: a novel mammalian polymerizing(ADP-ribosyl)transferase gene related to truncated pADPRT homologues in plants and Caenorhabditis
 FEBS Lett. 449:259-263(1999).

- FEBS LETT. A ROLE IN THE RESPONSE TO DNA DAMAGE.

- CAPALYTIC ACTIVITY: NOLE | + {ADD-D-ribosy1}(N)-acceptor = nicotinamide + {ADP-D-ribosy1}(N+1)-acceptor.

- FEBSUE SEMELLUAR LOCATION: Nuclear.

- TISSUE SPECIFICITY: Widely expressed; the highest levels were in testis followed by ovary.

- INDUCTION: By high levels of DNA-damaging agents.

- SIMILARITY: BELONGS TO THE PARP FAMILY.

 C. I. FUNCTION: POLY(ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY(ADP-RIBOSE) POLYMERASE MODIFIESTION IS DEPENDENT OF VARIOUS INFORMATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE RECULATION OF VARIOUS INFORMAT CELLULAR PROCESSES SUCH AS DIFFERENTIATION PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE RECULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

1. CATALYTIC ACTIVITY: NAD(+) + {ADP-D-tibosy1}(N)-acceptor - I.COFACTOR: INC. CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

2. I. SUBGUITT: HOMODIMER (Potential).

3. SUBGELLAULAR LOCATION: Nuclear.

4. NA SCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO THE 2'-POSITION OF THE TEXMINAL ADENOSINE MOLEY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.

2. STMILARITY: BELONGS TO THE PARP FAMILY.

CATALYTIC ACTIVITY: NAD-LACED CLIL FOR DIA CACCEPTOR -
INCOCTIONNIGE + {ADP-D-ribosy1}(N+1) - acceptor -
COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE BUZYME ITSELF, AND
THE TERMINAL ADP-RIBOSYL GROUP ON A HISTONE OR THE 2'-POSITION OF
THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER MITH AN
AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS 1 BRCT DOMAIN.

J. Biochem. 220:607-614(1994).

-! FUNCTION: POLY(ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY (ADP-RIBOSYL) ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERRATION, AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SMART; SM00292; BRCT; 1..., PROSITE; PS00172; BRCT; 1.

```

PROTEINS BY POLY (ADP-REDSYL) ATTON. THE MODIFIES WITHOUT IS DEPRINENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIEFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-TIDOSY1}(N)-acceptor - nicotinamide + {ADP-D-TIDOSY1}(N)+1)-acceptor.

-!- COFACTOR: ILMC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SUBCELLULAR PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: EXPRESSED IN ADULT FEMALE OCCTIES, ANAL PLATES OF STACE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM

IN LATER EMBRYOS.

DEVELOPMENTAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY IN EMBRYOS, PUPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.
MISCELLANBOUGS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUP ON A HISTONE OF THE ZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADBROSYLE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.

NUCLEAR LOCALIZATION SIGNAL 1ST PART
"The nuclear protein PH5P of the inter-alpha-inhibitor superfamily: missing link between poly(ADP-ribose)polymerase and the inter-alpha-inhibitor family and a novel actor of DNA repair?"; FEBS Lett. 446:6-8(1999).
-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!- SUBGUNIT: BINDS TO THE MAJOR VAULT PROTEIN (MPV). THE VAULT, A LARGE RIBONUCLEOPROTEIN COMPLEX, CONTAINS THE 100-kDA MPV AND 2
                                                                                                                                                                                                 PROTEINS OF 193 AND 240-KbA.
SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE NUCLEUS, ASSOCIATED WITH MITOTIC SPINDLES.
TISSUE SPECIFICITY: WIDELY EXPRESSED; THE HIGHEST LEVELS ARE IN THE KIDNEY; ALSO DEFECTED IN HEBRY, PLACEWINA, LUNG, LIVER, SKELETAL MUSCLE, SPLEEN, LEUKOCYTES AND PANCREAS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NUCLEAR LOCALIZATION SIGNAL 2ND PART

Total number of hits satisfying chosen parameters:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A Accession: T01311
A Accession: T01311
A Status: translated from GB/EMBL/DDBJ
A Status: 1635 <ALL>
A Cross-references: EMBL:AF069288: NID:g3193282; PID:g3193299
A Cross-references: EMBL:AF069288: NID:g3193282; PID:g3193299
A Status: Status: Columbia
A Status: Status: Status of an Arabidopsis thaliana cDNA homologue to animal poly(ADP-rA)
A Status: nucleic acid sequence not shown
A Status: nucleic acid sequence not shown
A Status: NED:B C CLEP>
A Residues: 1-115, GT', 116-635 <LEP>

C;Comment: This protein is a chromatin-bound enzyme.
C;Comment: This sorzyme catalyzes DNA-dependent post-translational modifications of var C;Superfamily: NAD+ ADP-ribosyltransferase; C;Keywords: DNA binding: 91ycosyltransferase; NAD; nucleus; pentosyltransferase; zinc

NAD+ ADP-ribosyltransferase (EC 2.4.2.30) - African clawed frog (fragment)
N.Alternate names: poly ADP-ribose polymerase
C.Species: Xenopus laevis (African clawed frog)
C.Species: Xenopus laevis (African clawed frog)
C.Satcession: S31735; PN0495
R.Saulier-le Drean, B.M.
Submitted to the EMBL Dia Library, May 1992
A.Reference number: S31735
A.Accession: S31735
A.Accession: S31735
A.Molecule type: mRNA
A.Residues: 1-988 <SAD.
